DETAILED ACTION

Continued Examination Under 37 CFR 1.114

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 01/19/2011 has been entered.

Response to Arguments

Applicant's arguments with respect to the claims have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-6, 8, 12-15, 16 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Laumen et al. (US 2003/0086438 herein Laumen) in view of Gabriel et al. (US 2004/0082348 herein Gabriel) in view of Shiigi (US 2004/0249899).

Claim 1, Laumen discloses a method for immediate delivery of an e-mail (0008, SMTP, email since SMTP is a known protocol for sending emails) to a

Art Unit: 2617

telecommunication device of a recipient (0008, UAB 11, 0006, UAB is an application on a user mobile device) via at least one telecommunication network (0008, Fig. 3: 6, Public Land Mobile Network),

wherein the e-mail is transmitted (0009, MMs originate from UAA) from a sender (0008, UAA 11, MM is forwarded) via a polled e-mail server (0008, Fig. 3: 2, Relay/Server (RSA 2), since message is sent via "RSA 2", thus it is a polled server) to the recipient

delivering the e-mail (0041, delivering the MM to the UAB 11, via "RSB 12") to a telecommunication terminal (0041, UAB 11) of the recipient via conventional MMS or WAP push systems (0041, Fig. 4: 12, RSB 12, MMS servers using WAP),

in that in that the e-mails are forwarded from the e-mail (0042, sending MM between "RSA 2" to "RSB 12") server to a specially configured push mail server (0042, Fig. 4: 12, "RSB 12") based on the e-mail address of the recipient (0363, receiving address in the message),

Laumen inherently discloses wherein the push mail server encapsulates the e-mail in a suitable content type, so that the e-mail can be transmitted via MMS or WAP push format (0041, delivery using WAP)

Laumen does not explicitly disclose from where they are delivered to the telecommunication terminal based on a telephone number which is included in the email [[or determined from a database, via conventional MMS or WAP push systems]], wherein a conventional WAP client or MMS client, which detects and processes the emails encapsulated in the suitable content type, is installed in the telecommunication terminal; if message units encapsulated with the suitable content type are detected, the

Art Unit: 2617

e-mail contained therein is extracted and transmitted to the e-mail client of the telecommunication terminal.

In an analogous art, Gabriel discloses from where they are delivered to the telecommunication terminal based on a telephone number, which is included in the email (0233, where Gabriel discloses sending the message to the intended recipient, after parsing the message). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Laumen by forwarding emails to devices based on addresses as taught by Gabriel so as to send messages to incompatible and distant cellular networks (0007).

Laumen in view of Gabriel does not explicitly disclose wherein a conventional WAP client or MMS client, which detects and processes the e- mails encapsulated in the suitable content type, is installed in the telecommunication terminal; if message units encapsulated with the suitable content type are detected, the e-mail contained therein is extracted and transmitted to the e-mail client of the telecommunication terminal.

In an analogous art, Shiigi discloses wherein a conventional WAP client or MMS client, which detects and processes the e- mails encapsulated in the suitable content type, is installed in the telecommunication terminal (0082-0084, encapsulated image in email is sent); if message units encapsulated with the suitable content type are detected, the e-mail contained therein is extracted (0084-0085, message transmitted to client and image is viewed, thus email is extracted) and transmitted to the e-mail client of the telecommunication terminal (0085, viewing email messages, thus email client). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Laumen in view of Gabriel to encapsulate

handwritten messages as taught by Shiigi so as to allow people to communicate with handwritten electronic messages (0006).

Claim 2, Laumen discloses the e-mail address of the recipient (0347).

Laumen does not explicitly disclose wherein a subscriber account is established for each subscriber on the push mail server, the subscriber account including at least the telephone number of at least one telecommunication terminal and the original email address of the recipient.

In an analogous art, Gabriel discloses wherein a subscriber account is established for each subscriber on the push mail server (0233, where Gabriel discloses account information), Gabriel discloses the subscriber account including at least the telephone number of at least one telecommunication terminal and the original email address of the recipient (0233, where Gabriel discloses a phone number, and 0234, where Gabriel discloses sending messages to the user's email). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Laumen to include account information and telephone numbers as taught by Gabriel so as to send messages to incompatible and distant cellular networks (0007).

Claim 3, Laumen discloses wherein forwarding of the e-mail from the e-mail server to the push mail server is controlled by a device and by applying forwarding rules (Fig. 4: 2 where forwarding of emails is based is done by a RSA).

Application/Control Number: 10/550,914

Art Unit: 2617

Claim 4, Laumen does not explicitly disclose wherein the push mail server determines the telephone number of the telecommunication terminal of the recipient from the employed push mail address.

In an analogous art, Gabriel discloses wherein the push mail server determines the telephone number of the telecommunication terminal of the recipient from the employed push mail address (0233, where Gabriel discloses parsing the address). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Laumen to include parsing the address as taught by Gabriel so as to send messages to incompatible and distant cellular networks (0007).

Claim 5, Laumen discloses wherein the push mail server is connected to the MMS or WAP push systems of the employed telecommunication network (Fig. 4: 2 & 12, where Laumen discloses a MMS-WAP push system).

Claim 6, Laumen discloses wherein the function of the push mail server is integrated directly in the existing e-mail server (0006, 0007, Fig. 2: 2,12, where Laumen discloses that it is well known to have a relay and server as one configuration).

Claim 8, Laumen discloses wherein a "message/rfc822" is employed as a content type (0008, 0373, where Laumen discloses an email address).

Claim 12, as analyzed with respect to the limitations as discussed in claim 1.

Application/Control Number: 10/550,914 Page 7

Art Unit: 2617

Claim 13, Laumen discloses wherein the telecommunication terminal is a mobile telecommunication terminal (0006, where Laumen discloses a mobile radio).

Claim 14, Laumen discloses wherein the telecommunication terminal is a landline telecommunication terminal (0013, where Laumen discloses a computer).

Claim 15, as analyzed with respect to the limitations as discussed in claim 2.

Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Laumen in view of Gabriel in view of Shiigi in view of Ala-Luukko et al. (US 2003/0064706 herein Luukko).

Laumen in view of Gabriel Shiigi does not disclose wherein the push mail server includes a billing mechanism, which is used to produce toll tickets for the billing system of telecommunication network operators or other service providers.

In an analogous art, Ala-Luukko discloses wherein the push mail server includes a billing mechanism, which is used to produce toll tickets for the billing system of telecommunication network operators or other service providers (0023, where Ala-Luukko discloses a billing tickets). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify Laumen in view of Gabriel in view of Shiigi to include billing tickets as taught by Ala-Luukko so as to track message transactions.

Conclusion

Application/Control Number: 10/550,914 Page 8
